

# GREAT HORNED OWL

## Fact Sheet

- A Great Horned Owl's strong talons require a force of 28 pounds to open
- The eyes of a great horned owl do not move. Instead, the owl is able to turn its head 270 degrees to look in any direction.
- The "horns" on their head are not ears. They are tufts of feathers, called plumicorns.
- Their hearing is 10x times better than that of a human.
- The great horned owl has cylindrical eyes—which acts sorta like binoculars.

**Job 42:5 (NIV)**

My ears had heard of you but now my eyes have seen you.
